Gold-coloured  
oval jewellery pendant

### Used items:

- 34 166 000** Jewellery-cement
- 36 056 000** Casting mould: Oval pendant, long
- 38 946 000** Set of templates 3, A5
- 33 384 00** Glue for foil
- 81 283 06** Mirror-foil, gold
- 22 246 06** Ring, 8mm ø, gold
- 22 662 89** Anchor chain gilded 60 cm, gold-plated
- 89 541 00** Flat round pliers for jewellery, 13.5 cm

### Instructions:

- 1** To cast the jewellery-cement-pendant you need an elastic casting mould, a digital scale and a small plastic container as well a craft wooden stick for stirring. The mixing ratio:  
1 part of water : 5 parts of jewellery-cement.
- 2** First, weigh the water in a cup and then add gradually the jewellery-cement. Stir it with a craft wooden stick until a homogeneous mass arises.
- 3** Now, you can fill the mould with the casting compound. The mould should always be cleaned with detergent and water before being filled. If bubbles occur, you should tap few times the mould on the pad.
- 4** The temperature and the current air humidity determine the drying time. It is however advisable to demould the pendant only the next day. Allow post drying.
- 5** The upper side, in other words the subsequent reverse side, you can rectify with some fine sandpaper.
- 6** To design the front side, lay on the adhesive template with geometrical small flowers and press on it slightly with a finger.
- 7** Take some glue with the flat brush and spread it evenly over the template. The glue should dry now until it is transparent.
- 8** Lay the mirror-foil, with the mirror-side upwards, onto the glue and rub it down with a finger.
- 9** Open the ringlet 8mm wide with two flat pliers and hang the anchor chain in. Close the ringlet by using the both pliers.
